

Summary

1. Complaint Volume Analysis

The total complaint count provides an overall view of customer dissatisfaction and serves as a key performance indicator (KPI) for monitoring service quality.

2. Submission Channel Performance

Analyzing complaint submission channels identifies the platforms customers use most frequently. This helps businesses prioritize resources for the most active communication channels and improve customer support accessibility.

3. State-wise Complaint Distribution

The top complaint-generating states highlight regions requiring greater operational focus. Higher complaint volumes may indicate a larger customer base or region-specific service challenges.

4. Product-wise Complaint Analysis

Products with the highest complaint counts represent areas where customers face the most issues. These products should be prioritized for process improvements and quality enhancement.

5. Most Common Customer Issues

Identifying the most frequent complaint issues helps businesses understand recurring customer problems and address their root causes instead of resolving complaints individually.

6. Timely Response Rate

Comparing timely response percentages across submission channels evaluates customer service efficiency. Channels with lower response rates may require workflow optimization or additional support resources.

7. Monthly Complaint Trend

Monthly complaint analysis helps identify fluctuations in customer complaints, enabling better workforce planning and preparation for periods with higher complaint volumes.

8. State-wise Product Performance

Using **RANK()**, the analysis identifies the state with the highest complaints for each product category. This reveals regional product-specific issues and supports targeted business strategies.

9. Year-over-Year Complaint Growth

The Year-over-Year growth analysis measures whether complaint volumes are increasing or decreasing over time, helping businesses evaluate changes in customer satisfaction and operational performance.

10. Top Complaint Issue by Product

Using **ROW_NUMBER()**, the project identifies the most common complaint issue for each product category. This enables product teams to focus on resolving the primary issue affecting each financial product.

Business Recommendations

- Improve products generating the highest complaint volumes.
- Investigate the most common complaint issues to reduce recurring customer problems.
- Allocate additional customer support resources to high-complaint states.
- Improve response efficiency for channels with lower timely response rates.
- Monitor monthly and yearly complaint trends to detect emerging issues early.
- Use product-specific complaint insights to implement targeted service and process improvements.
